

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

tinuity of the germ plasm. To be sure it is known that the germ plasm, the chromatin, is not an eternally unchangeable substance, as Weismann at first postulated. But the chromatin persists from generation to generation; the continuity of the germ plasm is what to-day is being termed the continuity of the chromosomes, and these continue from generation to generation, maintaining their individuality, just as much as a particular cell of one generation may be said to be represented by a particular cell of another.

Only some half dozen years ago, in the course of the conflict over the germ-plasm theory of Weismann, no workers upheld the occurrence of the reduction division except the school at Freiburg and one or two others. There even appeared a paper, presuming to be decisive, entitled "The Facts of Chromosome Reduction *versus* the Postulates of Weismann" (J. E. S. Moore, 1897). Since that time there has been much new research and by the comparative method, perhaps the safest of all methods, and the mass of evidence is now strongly corroborative of Weismann's two cardinal postulates. So to-day Weismann can point to the actual confirmation of the fundamental portion of his germ-plasm theory.

Stated Meeting, February 5, 1904.

President SMITH in the Chair.

The following papers were read:

"The Babylonian and Hebrew Accounts of the Creation, in the Light of Recent Criticism," by Prof. Morris Jastrow, Jr.

"The Miocene Diabase of the Santa Cruz Mountains in San Mateo County, California," by H. L. Haehl and Ralph Arnold, communicated by Prof. J. C. Branner.
